Mammals and Birds

A mammal is an animal that drinks milk from its mother and breathes air. Most mammals, like people and elephants, live on land. Some mammals live in the ocean. Because they feed and move in water, ocean mammals are different from land mammals in many ways.

The sea lion's body has a shape like a fish, so it can swim very fast. It doesn't have front legs, but it has flippers that pull it through the water.

A Sperm Whale

blowhole

Whales are ocean mammals. Like all whales, the sperm whale breathes through a hole on its head called a blowhole. Sperm whales can stay underwater for two hours, and they can dive a long way down into the ocean.

Some birds live, feed, and sleep on the ocean. They catch fish by diving under the water. Some birds only come to the seashore to make nests and to lay eggs.

The albatross has bigger wings than any other bird.

The two wings can be more than 3 meters wide! The albatross can fly up to 1,000 kilometers a day.
